Package 'gtsummary'

April 16, 2020

Title Presentation-Ready Data Summary and Analytic Result Tables

Version 1.3.0

Description Creates presentation-ready tables summarizing data sets, regression models, and more. The code to create the tables is concise and highly customizable. Data frames can be summarized with any function, e.g. mean(), median(), even user-written functions. Regression models are summarized and include the reference rows for categorical variables. Common regression models, such as logistic regression and Cox proportional hazards regression, are automatically identified and the tables are pre-filled with appropriate column headers.

add_global_p

Adds the global p-value for a categorical variables

Description

This function uses car::Anova with argument type = "III" to calculate global p-values for categorical variables. Output from tbl_regression and tbl_uvregression objects supported.

Usage

```
add_global_p(x, ...)
```

Arguments

x tbl_regression or tbl_uvregression object

... Further arguments passed to or from other methods.

Note

If a needed class of model is not supported by car::Anova, please create a GitHub Issue to request support.

Author(s)

Daniel D. Sjoberg

```
\verb|add_global_p.tbl_regression|, \verb|add_global_p.tbl_uvregression||
```

```
add_global_p.tbl_regression
```

Adds the global p-value for categorical variables

Description

This function uses car::Anova with argument type = "III" to calculate global p-values for categorical variables.

Usage

```
## S3 method for class 'tbl_regression'
add_global_p(
    x,
    include = x$table_body$variable[x$table_body$var_type %in% c("categorical",
        "interaction")],
    keep = FALSE,
    terms = NULL,
    ...
)
```

Arguments

х	Object with class tbl_regression from the tbl_regression function
include	Variables to calculate global p-value for. Input may be a vector of quoted or unquoted variable names. tidyselect and gtsummary select helper functions are also accepted. Default is NULL, which adds global p-values for all categorical and interaction terms.
keep	Logical argument indicating whether to also retain the individual p-values in the table output for each level of the categorical variable. Default is FALSE
terms	DEPRECATED. Use include= argument instead.
	Additional arguments to be passed to car::Anova

Value

A tbl_regression object

Note

If a needed class of model is not supported by car::Anova, please create a GitHub Issue to request support.

Example Output

Author(s)

Daniel D. Sjoberg

See Also

```
Other \ tbl\_regression \ tools: \ add\_nevent. \ tbl\_regression(), \ add\_q(), \ bold\_italicize\_labels\_levels, \\ combine\_terms(), \ inline\_text. \ tbl\_regression(), \ modify\_header(), \ tbl\_merge(), \ tbl\_regression(), \\ tbl\_stack()
```

Examples

```
tbl_lm_global_ex1 <-
  lm(marker ~ age + grade, trial) %>%
  tbl_regression() %>%
  add_global_p()
```

```
add_global_p.tbl_uvregression
```

Adds the global p-value for categorical variables

Description

This function uses car::Anova with argument type = "III" to calculate global p-values for categorical variables.

Usage

```
## S3 method for class 'tbl_uvregression' add_global_p(x, ...)
```

Arguments

x Object with class tbl_uvregression from the tbl_uvregression function

... Additional arguments to be passed to car::Anova.

Value

A tbl_uvregression object

Example Output

Author(s)

Daniel D. Sjoberg

```
Other tbl_uvregression tools: add_nevent.tbl_uvregression(), add_q(), bold_italicize_labels_levels, inline_text.tbl_uvregression(), modify_header(), tbl_merge(), tbl_stack(), tbl_uvregression()
```

6 add_n

Examples

```
tbl_uv_global_ex2 <-
  trial[c("response", "trt", "age", "grade")] %>%
  tbl_uvregression(
   method = glm,
   y = response,
   method.args = list(family = binomial),
   exponentiate = TRUE
  add_global_p()
```

add_n

Add column with N

Description

For each variable in a tbl_summary table, the add_n function adds a column with the total number of non-missing (or missing) observations

Usage

```
add_n(
 Х,
  statistic = "{n}",
  col_label = "**N**",
  footnote = FALSE,
 last = FALSE,
 missing = NULL
)
```

Arguments

Object with class tbl_summary from the tbl_summary function

statistic

String indicating the statistic to report. Default is the number of non-missing observation for each variable, statistic = "{n}". Other statistics available to report include:

- "{N}" total number of observations,
- "{n}" number of non-missing observations,
- "{n_miss}" number of missing observations,
- "{p}" percent non-missing data,
- "{p_miss}" percent missing data The argument uses glue::glue syntax and multiple statistics may be reported, e.g. statistic = $"\{n\} / \{N\} (\{p\}\%)"$

col_label

String indicating the column label. Default is "**N**"

footnote

Logical argument indicating whether to print a footnote clarifying the statistics presented. Default is FALSE

last

Logical indicator to include N column last in table. Default is FALSE, which will display N column first.

DEPRECATED. Logical argument indicating whether to print N (missing = FALSE), or N missing (missing = TRUE). Default is FALSE

missing

add_nevent 7

Value

A tbl_summary object

Example Output

Author(s)

Daniel D. Sjoberg

See Also

```
Other tbl_summary tools: add_overall(), add_p.tbl_summary(), add_q(), add_stat_label(), bold_italicize_labels_levels, inline_text.tbl_summary(), inline_text.tbl_survfit(), modify_header(), tbl_merge(), tbl_stack(), tbl_summary()
```

Examples

```
tbl_n_ex <-
  trial[c("trt", "age", "grade", "response")] %>%
  tbl_summary(by = trt) %>%
  add_n()
```

add_nevent

Add number of events to a regression table

Description

Adds a column of the number of events to tables created with tbl_regression or tbl_uvregression. Supported model types include GLMs with binomial distribution family (e.g. stats::glm, lme4::glmer, and geepack::geeglm) and Cox Proportion Hazards regression models (survival::coxph).

Usage

```
add_nevent(x, ...)
```

Arguments

```
x tbl_regerssion or tbl_uvregression object... Additional arguments passed to or from other methods.
```

Author(s)

Daniel D. Sjoberg

```
add_nevent.tbl_regression, add_nevent.tbl_uvregression, tbl_regression, tbl_uvregression
```

```
add_nevent.tbl_regression
```

Add number of events to a regression table

Description

This function adds a column of the number of events to tables created with tbl_regression. Supported model types include GLMs with binomial distribution family (e.g. stats::glm, lme4::glmer, and geepack::geeglm) and Cox Proportion Hazards regression models (survival::coxph).

The number of events is added to the internal .\$table_body tibble, and not printed in the default output table (similar to N). The number of events is accessible via the inline_text function for printing in a report.

Usage

```
## S3 method for class 'tbl_regression'
add_nevent(x, ...)
```

Arguments

```
x tbl_regression object
... Not used
```

Value

A tbl_regression object

Example Output

Author(s)

Daniel D. Sjoberg

See Also

```
Other tbl_regression tools: add_global_p.tbl_regression(), add_q(), bold_italicize_labels_levels, combine_terms(), inline_text.tbl_regression(), modify_header(), tbl_merge(), tbl_regression(), tbl_stack()
```

```
tbl_reg_nevent_ex <-
  glm(response ~ trt, trial, family = binomial) %>%
  tbl_regression() %>%
  add_nevent()
```

```
add_nevent.tbl_uvregression
```

Add number of events to a regression table

Description

Adds a column of the number of events to tables created with tbl_uvregression. Supported model types include GLMs with binomial distribution family (e.g. stats::glm, lme4::glmer, and geep-ack::geeglm) and Cox Proportion Hazards regression models (survival::coxph).

Usage

```
## S3 method for class 'tbl_uvregression'
add_nevent(x, ...)
```

Arguments

```
x tbl_uvregerssion object
... Not used
```

Value

A tbl_uvregression object

Reporting Event N

The number of events is added to the internal .\$table_body tibble, and printed to the right of the N column. The number of events is also accessible via the inline_text function for printing in a report.

Example Output

Author(s)

Daniel D. Sjoberg

See Also

```
Other tbl_uvregression tools: add_global_p.tbl_uvregression(), add_q(), bold_italicize_labels_levels, inline_text.tbl_uvregression(), modify_header(), tbl_merge(), tbl_stack(), tbl_uvregression()
```

```
tbl_uv_nevent_ex <-
  trial[c("response", "trt", "age", "grade")] %>%
  tbl_uvregression(
   method = glm,
    y = response,
   method.args = list(family = binomial)
) %>%
  add_nevent()
```

10 add_overall

add_overall

Add column with overall summary statistics

Description

Adds a column with overall summary statistics to tables created by tbl_summary.

Usage

```
add_overall(x, last = FALSE)
```

Arguments

x Object with class tbl_summary from the tbl_summary function

last Logical indicator to display overall column last in table. Default is FALSE, which

will display overall column first.

Value

A tbl_summary object

Example Output

Author(s)

Daniel D. Sjoberg

See Also

```
Other tbl_summary tools: add_n(), add_p.tbl_summary(), add_q(), add_stat_label(), bold_italicize_labels_inline_text.tbl_summary(), inline_text.tbl_survfit(), modify_header(), tbl_merge(), tbl_stack(), tbl_summary()
```

```
tbl_overall_ex <-
  trial[c("age", "response", "grade", "trt")] %>%
  tbl_summary(by = trt) %>%
  add_overall()
```

add_p 11

add_p

Adds p-values to gtsummary table

Description

Adds p-values to gtsummary table

Usage

```
add_p(x, ...)
```

Arguments

x Object created from a gtsummary function... Additional arguments passed to other methods.

Author(s)

Daniel D. Sjoberg

See Also

```
add_p.tbl_summary, add_p.tbl_cross
```

add_p.tbl_cross

Adds p-value to crosstab table

Description

Experimental Calculate and add a p-value comparing the two variables in the cross table.

Usage

```
## S3 method for class 'tbl_cross' add_p(x, test = NULL, pvalue_fun = NULL, source_note = FALSE, ...)
```

Arguments

Х	Object with class tbl_cross from the tbl_cross function
test	A string specifying statistical test to perform. Default is "chisq.test" when expected cell counts >= 5 and "fisher.test" when expected cell counts < 5.
pvalue_fun	Function to round and format p-value. Default is style_pvalue, except when source_note = TRUE when the default is style_pvalue(x,prepend_p = TRUE)
source_note	Logical value indicating whether to show p-value in the $\{gt\}$ table source notes rather than a column.
	Not used

12 add_p.tbl_summary

Example Output

Author(s)

Karissa Whiting

See Also

```
Other tbl_cross tools: inline_text.tbl_cross(), tbl_cross()
```

Examples

```
add_p_cross_ex1 <-
    trial %>%
    tbl_cross(row = stage, col = trt) %>%
    add_p()

add_p_cross_ex2 <-
    trial %>%
    tbl_cross(row = stage, col = trt) %>%
    add_p(source_note = TRUE)
```

add_p.tbl_summary

Adds p-values to summary tables

Description

Adds p-values to tables created by tbl_summary by comparing values across groups.

Usage

```
## S3 method for class 'tbl_summary'
add_p(
    x,
    test = NULL,
    pvalue_fun = NULL,
    group = NULL,
    include = everything(),
    exclude = NULL,
    ...
)
```

Arguments

add_p.tbl_summary 13

- "wilcox.test" for a Wilcoxon rank-sum test,
- "kruskal.test" for a Kruskal-Wallis rank-sum test.
- "chisq.test" for a chi-squared test of independence,
- "chisq.test.no.correct" for a chi-squared test of independence without continuity correction,
- "fisher.test" for a Fisher's exact test,
- "lme4" for a random intercept logistic regression model to account for clustered data, lme4::glmer(by ~ variable + (1 | group), family = binomial). The by argument must be binary for this option.

Tests default to "kruskal.test" for continuous variables, "chisq.test" for categorical variables with all expected cell counts >= 5, and "fisher.test" for categorical variables with any expected cell count < 5. A custom test function can be added for all or some variables. See below for an example.

pvalue_fun

Function to round and format p-values. Default is style_pvalue. The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. pvalue_fun = function(x) style_pvalue(x,digits = 2) or equivalently, purrr::partial(style_pvalue,digits = 2)).

group

Column name (unquoted or quoted) of an ID or grouping variable. The column can be used to calculate p-values with correlated data (e.g. when the test argument is "lme4"). Default is NULL. If specified, the row associated with this variable is omitted from the summary table.

include

Variables to include in output. Input may be a vector of quoted variable names, unquoted variable names, or tidyselect select helper functions. Default is everything().

exclude

DEPRECATED

... Not used

Value

A tbl_summary object

Setting Defaults

If you like to consistently use a different function to format p-values or estimates, you can set options in the script or in the user- or project-level startup file, '.Rprofile'. The default confidence level can also be set. Please note the default option for the estimate is the same as it is for tbl_regression().

• options(gtsummary.pvalue_fun = new_function)

Example Output

Author(s)

Emily C. Zabor, Daniel D. Sjoberg

14 add_q

See Also

See tbl_summary vignette for detailed examples

```
Other tbl_summary tools: add_n(), add_overall(), add_q(), add_stat_label(), bold_italicize_labels_levels inline_text.tbl_summary(), inline_text.tbl_survfit(), modify_header(), tbl_merge(), tbl_stack(), tbl_summary()
```

Examples

```
add_p_ex1 <-
  trial[c("age", "grade", "response", "trt")] %>%
  tbl_summary(by = trt) %>%
  add_p()
# Conduct a custom McNemar test for response,
# Function must return a named list of the p-value and the
# test name: list(p = 0.123, test = "McNemar's test")
\# The '...' must be included as input
\ensuremath{\mathtt{\#}} This feature is experimental, and the API may change in the future
my_mcnemar <- function(data, variable, by, ...) {</pre>
  result <- list()
  result$p <- stats::mcnemar.test(data[[variable]], data[[by]])$p.value</pre>
  result$test <- "McNemar's test"</pre>
  result
add_p_ex2 <-
  trial[c("response", "trt")] %>%
  tbl_summary(by = trt) %>%
  add_p(test = response ~ "my_mcnemar")
```

add_q

Add a column of q-values to account for multiple comparisons

Description

Adjustments to p-values are performed with stats::p.adjust.

Usage

```
add_q(x, method = "fdr", pvalue_fun = NULL)
```

Arguments

x a gtsummary object

method String indicating method to be used for p-value adjustment. Methods from stats::p.adjust are accepted. Default is method = "fdr".

pvalue_fun Function to round and format p-values. Default is style_pvalue. The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. pvalue_fun = function(x) style_pvalue(x,digits = 2) or equivalently, purrr::partial(style_pvalue,digits = 2)).

add_stat_label 15

Example Output

Author(s)

Esther Drill, Daniel D. Sjoberg

See Also

```
Other tbl_summary tools: add_n(), add_overall(), add_p.tbl_summary(), add_stat_label(), bold_italicize_labels_levels, inline_text.tbl_summary(), inline_text.tbl_survfit(), modify_header(), tbl_merge(), tbl_stack(), tbl_summary()

```

Examples

```
tbl_sum_q_ex1 <-
    trial[c("trt", "age", "grade", "response")] %>%
    tbl_summary(by = trt) %>%
    add_p() %>%
    add_q()

tbl_uv_q_ex2 <-
    trial[c("trt", "age", "grade", "response")] %>%
    tbl_uvregression(
    y = response,
    method = glm,
    method.args = list(family = binomial),
    exponentiate = TRUE
) %>%
    add_global_p() %>%
    add_q()
```

add_stat_label

Add statistic labels column

Description

Adds a column with labels describing the summary statistics presented for each variable in the tbl_summary table.

Usage

```
add_stat_label(x)
```

Arguments

Χ

Object with class tbl_summary from the tbl_summary function

16 as_flextable

Value

A tbl_summary object

Example Output

Author(s)

Daniel D. Sjoberg

See Also

```
Other tbl_summary tools: add_n(), add_overall(), add_p.tbl_summary(), add_q(), bold_italicize_labels_levinline_text.tbl_summary(), inline_text.tbl_survfit(), modify_header(), tbl_merge(), tbl_stack(), tbl_summary()
```

Examples

```
tbl_stat_ex <-
  trial[c("trt", "age", "grade", "response")] %>%
  tbl_summary() %>%
  add_stat_label()
```

as_flextable

Convert gtsummary object to a flextable object

Description

Experimental Function converts a gtsummary object to a flextable object. A user can use this function if they wish to add customized formatting available via the flextable functions. The flextable output is particularly useful when combined with R markdown with Word output, since the gt package does not support Word.

Usage

```
as_flextable(x, ...)
## S3 method for class 'gtsummary'
as_flextable(
    x,
    include = everything(),
    return_calls = FALSE,
    strip_md_bold = TRUE,
    ...
)
```

as_flextable 17

Arguments

Х	Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
	Not used
include	Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything().
return_calls	Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
strip_md_bold	When TRUE, all double asterisk (markdown language for bold weight) in column labels and spanning headers are removed. Default is TRUE

Value

A flextable object

Details

The as_flextable() takes the data frame that will be printed and converts it to a flextable and formats the table with the following flextable functions.

```
    flextable::flextable()
    flextable::set_header_labels() to set column labels
    flextable::add_header_row(), if applicable, to set spanning column header
    flextable::align() to set column alignment
    flextable::padding() to indent variable levels
    flextable::autofit() to estimate the column widths
    flextable::footnote() to add table footnotes and source notes
    flextable::bold() to bold cells in data frame
    flextable::italic() to italicize cells in data frame
```

Any one of these commands may be omitted using the include= argument.

Pro tip: Use the flextable::width() function for exacting control over column width after calling as_flextable().

Author(s)

Daniel D. Sjoberg

See Also

```
Other gtsummary output types: as_gt(), as_kable_extra(), as_kable(), as_tibble.gtsummary()
```

```
trial %>%
  dplyr::select(trt, age, grade) %>%
  tbl_summary(by = trt) %>%
  add_p() %>%
  as_flextable()
```

 as_gt

as_gt

Convert gtsummary object to a gt object

Description

Function converts a gtsummary object to a gt_tbl object. Function is used in the background when the results are printed or knit. A user can use this function if they wish to add customized formatting available via the gt package.

Review the tbl_summary vignette or tbl_regression vignette for detailed examples in the 'Advanced Customization' section.

Usage

```
as_gt(
   x,
   include = everything(),
   return_calls = FALSE,
   exclude = NULL,
   omit = NULL
)
```

Arguments

x Object created by a function from the gtsummary package (e.g. tbl_summary or

tbl_regression)

include Commands to include in output. Input may be a vector of quoted or unquoted

names. tidyselect and gtsummary select helper functions are also accepted. De-

fault is everything().

return_calls Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.

exclude DEPRECATED.
omit DEPRECATED.

Value

A gt_tbl object

Example Output

Author(s)

Daniel D. Sjoberg

See Also

Other gtsummary output types: as_flextable(), as_kable_extra(), as_kable(), as_tibble.gtsummary()

as_kable 19

Examples

```
as_gt_ex <-
  trial[c("trt", "age", "response", "grade")] %>%
  tbl_summary(by = trt) %>%
  as_gt()
```

as_kable

Convert gtsummary object to a kable object

Description

Function converts a gtsummary object to a knitr_kable object. This function is used in the background when the results are printed or knit. A user can use this function if they wish to add customized formatting available via knitr::kable.

Output from knitr::kable is less full featured compared to summary tables produced with gt. For example, kable summary tables do not include indentation, footnotes, or spanning header rows.

Usage

```
as_kable(x, include = everything(), return_calls = FALSE, exclude = NULL, ...)
```

Arguments

X	Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
include	Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything(), which includes all commands in x\$kable_calls.
return_calls	Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
exclude	DEPRECATED
	Additional arguments passed to knitr::kable

Details

Tip: To better distinguish variable labels and level labels when indenting is not supported, try bold_labels() or italicize_levels().

Value

```
A knitr_kable object
```

Author(s)

Daniel D. Sjoberg

```
Other gtsummary output types: as_flextable(), as_gt(), as_kable_extra(), as_tibble.gtsummary()
```

20 as_kable_extra

Examples

```
trial %>%
  tbl_summary(by = trt) %>%
  bold_labels() %>%
  as_kable()
```

as_kable_extra

Convert gtsummary object to a kableExtra object

Description

Experimental Function converts a gtsummary object to a knitr_kable + kableExtra object. A user can use this function if they wish to add customized formatting available via knitr::kable and kableExtra. Note that gtsummary uses the standard markdown ** to bold headers, and they may need to be changed manually with kableExtra output.

Usage

```
as_kable_extra(
   x,
   include = everything(),
   return_calls = FALSE,
   strip_md_bold = TRUE,
   ...
)
```

Arguments

X	Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
include	Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything(), which includes all commands in x\$kable_calls.
return_calls	Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
strip_md_bold	When TRUE, all double asterisk (markdown language for bold weight) in column labels and spanning headers are removed. Default is TRUE
	Additional arguments passed to knitr::kable

Value

A kableExtra object

Author(s)

Daniel D. Sjoberg

```
Other gtsummary output types: as_flextable(), as_gt(), as_kable(), as_tibble.gtsummary()
```

as_tibble.gtsummary 21

Examples

```
tbl <-
  trial %>%
  tbl_summary(by = trt) %>%
  as_kable_extra()
```

as_tibble.gtsummary

Convert gtsummary object to a tibble

Description

Function converts gtsummary objects tibbles. The formatting stored in x\$kable_calls is applied.

Usage

```
## S3 method for class 'gtsummary'
as_tibble(
    x,
    include = everything(),
    col_labels = TRUE,
    return_calls = FALSE,
    exclude = NULL,
    ...
)
```

Arguments

Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
 include Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything(), which includes all commands in x\$kable_calls.
 col_labels Logical argument adding column labels to output tibble. Default is TRUE.
 return_calls Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
 exclude DEPRECATED
 Not used

Value

a tibble

Author(s)

Daniel D. Sjoberg

```
Other gtsummary output types: as_flextable(), as_gt(), as_kable_extra(), as_kable()
```

Examples

```
tbl <-
   trial %>%
   dplyr::select(trt, age, grade, response) %>%
   tbl_summary(by = trt)

as_tibble(tbl)

# without column labels
as_tibble(tbl, col_labels = FALSE)
```

bold_italicize_labels_levels

Bold or Italicize labels or levels in gtsummary tables

Description

Bold or Italicize labels or levels in gtsummary tables

Usage

```
bold_labels(x)
bold_levels(x)
italicize_labels(x)
italicize_levels(x)
```

Arguments

Х

Object created using gtsummary functions

Value

Functions return the same class of gtsummary object supplied

Functions

- bold_labels: Bold labels in gtsummary tables
- bold_levels: Bold levels in gtsummary tables
- italicize_labels: Italicize labels in gtsummary tables
- italicize_levels: Italicize levels in gtsummary tables

Example Output

Author(s)

Daniel D. Sjoberg

bold_p 23

See Also

```
Other tbl_summary tools: add_n(), add_overall(), add_p.tbl_summary(), add_q(), add_stat_label(), inline_text.tbl_summary(), inline_text.tbl_survfit(), modify_header(), tbl_merge(), tbl_stack(), tbl_summary()

Other tbl_regression tools: add_global_p.tbl_regression(), add_nevent.tbl_regression(), add_q(), combine_terms(), inline_text.tbl_regression(), modify_header(), tbl_merge(), tbl_regression(), tbl_stack()

Other tbl_uvregression tools: add_global_p.tbl_uvregression(), add_nevent.tbl_uvregression(), add_q(), inline_text.tbl_uvregression(), modify_header(), tbl_merge(), tbl_stack(), tbl_uvregression()
```

Examples

```
tbl_bold_ital_ex <-
  trial[c("trt", "age", "grade")] %>%
  tbl_summary() %>%
  bold_labels() %>%
  bold_levels() %>%
  italicize_labels() %>%
  italicize_levels()
```

bold_p

Bold significant p-values or q-values

Description

Bold values below a chosen threshold (e.g. <0.05) in a gtsummary tables.

Usage

```
bold_p(x, t = 0.05, q = FALSE)
```

Arguments

- x Object created using gtsummary functions
- t Threshold below which values will be bold. Default is 0.05.
- q Logical argument. When TRUE will bold the q-value column rather than the p-values. Default is FALSE.

Example Output

Author(s)

Daniel D. Sjoberg, Esther Drill

24 combine_terms

Examples

```
tbl_sum_bold_p_ex <-
    trial[c("age", "grade", "response", "trt")] %>%
    tbl_summary(by = trt) %>%
    add_p() %>%
    bold_p(t = 0.65)

tbl_lm_bold_p_ex <-
    glm(response ~ trt + grade, trial, family = binomial(link = "logit")) %>%
    tbl_regression(exponentiate = TRUE) %>%
    bold_p(t = 0.65)
```

combine_terms

Combine terms in a regression model

Description

Experimental The function combines terms from a regression model, and replaces the terms with a single row in the output table. The p-value is calculated using stats::anova().

Usage

```
combine_terms(x, formula_update, label = NULL, ...)
```

Arguments

x a tbl_regression object

formula_update formula update passed to the stats::update. This updated formula is used to construct a reduced model, and is subsequently passed to stats::anova() to

construct a reduced model, and is subsequently passed to stats::anova() to calculate the p-value for the group of removed terms. See the stats::update help

file for proper syntax. function's formula.= argument

label Option string argument labeling the combined rows

... Additional arguments passed to stats::anova

Value

```
tbl_regression object
```

Example Output

Author(s)

Daniel D. Sjoberg

```
Other tbl_regression tools: add_global_p.tbl_regression(), add_nevent.tbl_regression(), add_q(), bold_italicize_labels_levels, inline_text.tbl_regression(), modify_header(), tbl_merge(), tbl_regression(), tbl_stack()
```

gtsummary_logo 25

Examples

```
# fit model with nonlinear terms for marker
nlmod1 <- lm(
  age ~ marker + I(marker^2) + grade,
  trial[c("age", "marker", "grade")] %>% na.omit() # keep complete cases only!
combine_terms_ex1 <-</pre>
  tbl_regression(nlmod1, label = grade ~ "Grade") %>%
  # collapse non-linear terms to a single row in output using anova
  combine_terms(
    formula_update = . ~ . - marker - I(marker^2),
    label = "Marker (non-linear terms)"
  )
# Example with Cubic Splines
library(Hmisc)
mod2 <- lm(
  age ~ rcspline.eval(marker, inclx = TRUE) + grade,
  trial[c("age", "marker", "grade")] %>% na.omit() # keep complete cases only!
combine_terms_ex2 <-</pre>
  tbl_regression(mod2, label = grade ~ "Grade") %>%
  combine_terms(
    formula_update = . ~ . -rcspline.eval(marker, inclx = TRUE),
    label = "Marker (non-linear terms)"
# Logistic Regression Example, LRT p-value
combine_terms_ex3 <-</pre>
  glm(
    response ~ marker + I(marker^2) + grade,
    trial[c("response", "marker", "grade")] %>% na.omit(), # keep complete cases only!
   family = binomial
  ) %>%
  tbl_regression(label = grade ~ "Grade", exponentiate = TRUE) %>%
  # collapse non-linear terms to a single row in output using anova
  combine_terms(
    formula_update = . ~ . - marker - I(marker^2),
    label = "Marker (non-linear terms)",
    test = "LRT"
  )
```

gtsummary_logo

The gtsummary logo, using ASCII or Unicode characters

Description

```
Use crayon::strip_style() to get rid of the colors.
```

Usage

```
gtsummary_logo(unicode = l10n_info()$`UTF-8`)
```

26 inline_text.tbl_cross

Arguments

unicode

Whether to use Unicode symbols. Default is TRUE on UTF-8 platforms.

Examples

```
gtsummary_logo()
```

inline_text

Report statistics from gtsummary tables inline

Description

Report statistics from gtsummary tables inline

Usage

```
inline_text(x, ...)
```

Arguments

x Object created from a gtsummary function

... Additional arguments passed to other methods.

Value

A string reporting results from a gtsummary table

Author(s)

Daniel D. Sjoberg

See Also

inline_text.tbl_summary, inline_text.tbl_regression, inline_text.tbl_uvregression, inline_text.tbl_survfit

inline_text.tbl_cross Report statistics from cross table inline

Description

Experimental Extracts and returns statistics from a tbl_cross object for inline reporting in an R markdown document. Detailed examples in the inline_text vignette

inline_text.tbl_cross 27

Usage

```
## S3 method for class 'tbl_cross'
inline_text(
    x,
    col_level,
    row_level = NULL,
    pattern = NULL,
    pvalue_fun = function(x) style_pvalue(x, prepend_p = TRUE),
    ...
)
```

Arguments

X	a tbl_cross object
col_level	Level of the column variable to display. Can also specify "p.value" for the p-value and "stat_0" for Total column.
row_level	Level of the row variable to display. Can also specify the 'Unknown' row. Default is NULL
pattern	String indicating the statistics to return. Uses glue::glue formatting. Default is pattern shown in tbl_cross() output
pvalue_fun	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. pvalue_fun = function(x) style_pvalue(x,digits = 2) or equivalently, purrr::partial(style_pvalue,digits = 2)).
	Not used

Value

A string reporting results from a gtsummary table

See Also

```
Other tbl_cross tools: add_p.tbl_cross(), tbl_cross()
```

```
tbl_cross <-
  tbl_cross(trial, row = trt, col = response) %>%
  add_p()

inline_text(tbl_cross, row_level = "Drug A", col_level = "1")
inline_text(tbl_cross, row_level = "Total", col_level = "1")
inline_text(tbl_cross, col_level = "p.value")
```

```
inline_text.tbl_regression
```

Report statistics from regression summary tables inline

Description

Takes an object with class tbl_regression, and the location of the statistic to report and returns statistics for reporting inline in an R markdown document. Detailed examples in the inline_text vignette

Usage

Arguments

x	Object created from tbl_regression
variable	Variable name of statistics to present
level	Level of the variable to display for categorical variables. Default is NULL, returning the top row in the table for the variable.
pattern	String indicating the statistics to return. Uses glue::glue formatting. Default is "{estimate} ({conf.level }% CI {conf.low}, {conf.high}; {p.value})". All columns from x\$table_body are available to print as well as the confidence level (conf.level). See below for details.
estimate_fun	function to style model coefficient estimates. Columns 'estimate', 'conf.low', and 'conf.high' are formatted. Default is x\$inputs\$estimate_fun
pvalue_fun	function to style p-values and/or q-values. Default is $function(x)$ $style_pvalue(x,prepend_p = TRUE)$
	Not used

Value

A string reporting results from a gtsummary table

pattern argument

The following items are available to print. Use print(x\$table_body) to print the table the estimates are extracted from.

• {estimate} coefficient estimate formatted with 'estimate_fun'

- {conf.low} lower limit of confidence interval formatted with 'estimate_fun'
- {conf.high} upper limit of confidence interval formatted with 'estimate_fun'
- {ci} confidence interval formatted with x\$estimate_fun
- {p.value} p-value formatted with 'pvalue_fun'
- {N} number of observations in model
- {label} variable/variable level label

Author(s)

Daniel D. Sjoberg

Examples

```
inline_text_ex1 <-
   glm(response ~ age + grade, trial, family = binomial(link = "logit")) %>%
   tbl_regression(exponentiate = TRUE)

inline_text(inline_text_ex1, variable = age)
inline_text(inline_text_ex1, variable = grade, level = "III")
```

```
inline_text.tbl_summary
```

Report statistics from summary tables inline

Description

Extracts and returns statistics from a tbl_summary object for inline reporting in an R markdown document. Detailed examples in the inline_text vignette

Usage

```
## S3 method for class 'tbl_summary'
inline_text(
    x,
    variable,
    column = NULL,
    level = NULL,
    pattern = NULL,
    pvalue_fun = function(x) style_pvalue(x, prepend_p = TRUE),
    ...
)
```

30 inline_text.tbl_survfit

Arguments

X	Object created from tbl_summary
variable	Variable name of statistic to present
column	Column name to return from x\$table_body. Can also pass the level of a by variable.
level	Level of the variable to display for categorical variables. Can also specify the 'Unknown' row. Default is NULL
pattern	String indicating the statistics to return. Uses glue::glue formatting. Default is pattern shown in tbl_summary() output
pvalue_fun	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. pvalue_fun = function(x) style_pvalue(x,digits = 2) or equivalently, purrr::partial(style_pvalue,digits = 2)).
	Not used

t1 <- tbl_summary(trial)
t2 <- tbl_summary(trial, by = trt) %>% add_p()

inline_text(t1, variable = age)
inline_text(t2, variable = grade, level = "I", column = "Drug A",
pattern = "{n}/{N} ({p})%")
inline_text(t2, variable = grade, column = "p.value")
```

```
inline_text.tbl_survfit
```

Report statistics from survfit tables inline

Description

Experimental Extracts and returns statistics from a tbl_survfit object for inline reporting in an R markdown document. Detailed examples in the inline_text vignette

inline_text.tbl_survfit 31

Usage

```
## S3 method for class 'tbl_survfit'
inline_text(
    x,
    time = NULL,
    prob = NULL,
    level = NULL,
    estimate_fun = NULL,
    pvalue_fun = function(x) style_pvalue(x, prepend_p = TRUE),
    ...
)
```

Arguments

Object created from tbl_survfit

time time for which to return survival probabilities.

prob probability with values in (0,1)

level Level of the variable to display for categorical variables. Can also specify the

'Unknown' row. Default is NULL

estimate_fun Function to round and format coefficient estimates. Default is style_sigfig when

the coefficients are not transformed, and style_ratio when the coefficients have

been exponentiated.

pvalue_fun Function to round and format p-values. Default is style_pvalue. The function

must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. pvalue_fun = function(x)

style_pvalue(x,digits = 2) or equivalently, purrr::partial(style_pvalue,digits

= 2)).

```

Not used

inline_text.tbl_uvregression

Report statistics from regression summary tables inline

Description

Extracts and returns statistics from a table created by the tbl_uvregression function for inline reporting in an R markdown document. Detailed examples in the inline_text vignette

Usage

```
## S3 method for class 'tbl_uvregression'
inline_text(
    x,
    variable,
    level = NULL,
    pattern = "{estimate} ({conf.level*100}% CI {conf.low}, {conf.high}; {p.value})",
    estimate_fun = x$fmt_fun$estimate,
    pvalue_fun = function(x) style_pvalue(x, prepend_p = TRUE),
    ...
)
```

Arguments

. . .

X	Object created from tbl_uvregression
variable	Variable name of statistics to present
level	Level of the variable to display for categorical variables. Default is NULL, returning the top row in the table for the variable.
pattern	String indicating the statistics to return. Uses glue::glue formatting. Default is "{estimate} ({conf.level }% CI {conf.low},{conf.high}; {p.value})". All columns from x\$table_body are available to print as well as the confidence level (conf.level). See below for details.
estimate_fun	function to style model coefficient estimates. Columns 'estimate', 'conf.low', and 'conf.high' are formatted. Default is x\$inputs\$estimate_fun
pvalue_fun	function to style p-values and/or q-values. Default is $function(x)$ $style_pvalue(x,prepend_p = TRUE)$

modify_header 33

Value

A string reporting results from a gtsummary table

pattern argument

The following items are available to print. Use print(x\$table_body) to print the table the estimates are extracted from.

- {estimate} coefficient estimate formatted with 'estimate_fun'
- {conf.low} lower limit of confidence interval formatted with 'estimate_fun'
- {conf.high} upper limit of confidence interval formatted with 'estimate_fun'
- {ci} confidence interval formatted with x\$estimate_fun
- {p.value} p-value formatted with 'pvalue_fun'
- {N} number of observations in model
- {label} variable/variable level label

Author(s)

Daniel D. Sjoberg

See Also

```
Other tbl_uvregression tools: add_global_p.tbl_uvregression(), add_nevent.tbl_uvregression(), add_q(), bold_italicize_labels_levels, modify_header(), tbl_merge(), tbl_stack(), tbl_uvregression()
```

Examples

```
inline_text_ex1 <-
  trial[c("response", "age", "grade")] %>%
  tbl_uvregression(
    method = glm,
    method.args = list(family = binomial),
    y = response,
    exponentiate = TRUE
  )

inline_text(inline_text_ex1, variable = age)
inline_text(inline_text_ex1, variable = grade, level = "III")
```

modify_header

Modify column headers in gtsummary tables

Description

Column labels can be modified to include calculated statistics; e.g. the N can be dynamically included by wrapping it in curly brackets (following glue::glue syntax).

Usage

```
modify_header(x, stat_by = NULL, ..., text_interpret = c("md", "html"))
```

34 modify_header

Arguments

gtsummary object, e.g. tbl_summary or tbl_regression Х String specifying text to include above the summary statistics stratified by a stat_by variable. Only use with stratified tbl_summary objects. The following fields are available for use in the headers: • {n} number of observations in each group, • {N} total number of observations, • {p} percentage in each group, • {level} the 'by' variable level, • "fisher.test" for a Fisher's exact test, Syntax follows glue::glue, e.g. stat_by = "**{level}**, N = {n} ({style_percent(p)\%})". The by argument from the parent tbl_summary() cannot be NULL. Specifies column label of any other column in .\$table_body. Argument is the column name, and the value is the new column header (e.g. p.value = "Model P-values"). Use print(x\$table_body) to see columns available. text_interpret indicates whether text will be interpreted as markdown ("md") or HTML ("html").

The text is interpreted with the gt package's md() or html() functions. The de-

fault is "md", and is ignored when the print engine is not gt.

Value

Function return the same class of gtsummary object supplied

Example Output

tbl_summary tbl_regression tbl_uvregression tbl_merge tbl_stack

select_helpers

Select helper functions

Description

Set of functions to supplement the tidyselect set of functions for selecting columns of data frames. all_continuous(), all_categorical(), and all_dichotomous() may only be used with tbl_summary(), where each variable has been classified into one of these three groups. All other helpers are available throughout the package.

36 sort_p

Usage

```
all_continuous()
all_categorical(dichotomous = TRUE)
all_dichotomous()
all_numeric()
all_character()
all_integer()
all_double()
all_logical()
all_factor()
```

Arguments

dichotomous

Logical indicating whether to include dichotomous variables. Default is TRUE

Value

A character vector of column names selected

Examples

```
select_ex1 <-
  trial %>%
  dplyr::select(age, response, grade) %>%
  tbl_summary(
    statistic = all_continuous() ~ "{mean} ({sd})",
    type = all_dichotomous() ~ "categorical"
)
```

sort_p

Sort variables in table by ascending p-values

Description

Sort tables created by gtsummary by p-values

Usage

```
sort_p(x, q = FALSE)
```

Arguments

x An object created using gtsummary functions

q Logical argument. When TRUE will sort by the q-value column

style_percent 37

Example Output

Author(s)

Karissa Whiting

Examples

```
tbl_sum_sort_p_ex <-
    trial[c("age", "grade", "response", "trt")] %>%
    tbl_summary(by = trt) %>%
    add_p() %>%
    sort_p()

tbl_lm_sort_p_ex <-
    glm(response ~ trt + grade, trial, family = binomial(link = "logit")) %>%
    tbl_regression(exponentiate = TRUE) %>%
    sort_p()
```

style_percent

Style percentages to be displayed in tables or text

Description

Style percentages to be displayed in tables or text

Usage

```
style_percent(x, symbol = FALSE)
```

Arguments

x numeric vector of percentages

symbol Logical indicator to include percent symbol in output. Default is FALSE.

Value

A character vector of styled percentages

Author(s)

Daniel D. Sjoberg

See Also

```
See Table Gallery vignette for example
Other style tools: style_pvalue(), style_ratio(), style_sigfig()
```

```
\label{eq:cont_vals} $$ \  \  - c(-1, 0, 0.0001, 0.005, 0.01, 0.10, 0.45356, 0.99, 1.45) $$ style\_percent(percent\_vals) $$ style\_percent(percent\_vals, symbol = TRUE) $$
```

38 style_pvalue

style_pvalue

Style p-values to be displayed in tables or text

Description

Style p-values to be displayed in tables or text

Usage

```
style_pvalue(x, digits = 1, prepend_p = FALSE)
```

Arguments

x Numeric vector of p-values.

prepend_p Logical. Should 'p=' be prepended to formatted p-value. Default is FALSE

Value

A character vector of styled p-values

Author(s)

Daniel D. Sjoberg

See Also

```
See tbl_summary vignette for examples

Other style tools: style_percent(), style_ratio(), style_sigfig()
```

```
pvals <- c(
    1.5, 1, 0.999, 0.5, 0.25, 0.2, 0.197, 0.12, 0.10, 0.0999, 0.06,
    0.03, 0.002, 0.001, 0.00099, 0.0002, 0.00002, -1
)
style_pvalue(pvals)
style_pvalue(pvals, digits = 2, prepend_p = TRUE)</pre>
```

style_ratio 39

style_ratio

Implement significant figure-like rounding for ratios

Description

When reporting ratios, such as relative risk or an odds ratio, we'll often want the rounding to be similar on each side of the number 1. For example, if we report an odds ratio of 0.95 with a confidence interval of 0.70 to 1.24, we would want to round to two decimal places for all values. In other words, 2 significant figures for numbers less than 1 and 3 significant figures 1 and larger. style_ratio() performs significant figure-like rounding in this manner.

Usage

```
style_ratio(x, digits = 2)
```

Arguments

x Numeric vector

digits

Integer specifying the number of significant digits to display for numbers below 1. Numbers larger than 1 will be be digits + 1. Default is digits = 2.

Value

A character vector of styled ratios

Author(s)

Daniel D. Sjoberg

See Also

```
Other style tools: style_percent(), style_pvalue(), style_sigfig()
```

```
c(
 0.123, 0.9, 1.1234, 12.345, 101.234, -0.123,
 -0.9, -1.1234, -12.345, -101.234
) %>%
 style_ratio()
```

40 style_sigfig

style_sigfig

Implement significant figure-like rounding

Description

Converts a numeric argument into a string that has been rounded to a significant figure-like number. Scientific notation output is avoided, however, and additional significant figures may be displayed for large numbers. For example, if the number of significant digits requested is 2, 123 will be displayed (rather than 120 or 1.2x10^2).

Usage

```
style\_sigfig(x, digits = 2)
```

Arguments

x Numeric vector

digits Integer specifying the minimum number of significant digits to display

Details

If 2 sig figs are input, the number is rounded to 2 decimal places when abs(x) < 1, 1 decimal place when abs(x) >= 1 & abs(x) < 10, and to the nearest integer when abs(x) >= 10.

Value

A character vector of styled numbers

```

tbl_cross 41

tbl_cross

Create a cross table of summary statistics

Description

Experimental The function creates a cross table of two categorical variables.

Usage

```
tbl_cross(
  data,
  row = NULL,
  col = NULL,
  label = NULL,
  statistic = NULL,
  percent = c("none", "column", "row", "cell"),
  missing = c("ifany", "always", "no"),
  missing_text = "Unknown",
  margin_text = "Total"
)
```

A data frame

Arguments

data

aaca	Trusta frame
row	A column name in data to be used for columns of cross table.
col	A column name in data to be used for rows of cross table.
label	List of formulas specifying variables labels, e.g. list(age ~ "Age,yrs", stage ~ "Path T Stage"). If a variable's label is not specified here, the label attribute (attr(data\$age,"label")) is used. If attribute label is NULL, the variable name will be used.
statistic	A string with the statistic name in curly brackets to be replaced with the numeric statistic (see glue::glue). The default is $\{n\}$. If percent argument is "column", "row", or "cell", default is $\{n\}$ ($\{p\}\%$).
percent	Indicates the type of percentage to return. Must be one of "none", "column", "row", or "cell". Default is "cell" when {N} or {p} is used in statistic.
missing	Indicates whether to include counts of NA values in the table. Allowed values are "no" (never display NA values), "ifany" (only display if any NA values), and "always" (includes NA count row for all variables). Default is "ifany".
missing_text	String to display for count of missing observations. Default is "Unknown".
margin_text	Text to display for margin totals. Default is "Total"

Value

A tbl_cross object

Example Output

42 tbl_merge

Author(s)

   trial %>%
   tbl_cross(row = trt, col = response)

tbl_cross_ex2 <-
   trial %>%
   tbl_cross(row = stage, col = trt) %>%
   add_p()
```

tbl_merge

Merge two or more gtsummary objects

Description

Merges two or more tbl_regression, tbl_uvregression, tbl_stack, or tbl_summary objects and adds appropriate spanning headers.

Usage

```
tbl_merge(tbls, tab_spanner = NULL)
```

Arguments

tbls List of gtsummary objects to merge

tab_spanner Character vector specifying the spanning headers. Must be the same length as

tbls. The strings are interpreted with gt::md. Must be same length as tbls

argument

Value

```
A tbl_merge object
```

Example Output

```

44 tbl_regression

Description

This function takes a regression model object and returns a formatted table that is publicationready. The function is highly customizable allowing the user to obtain a bespoke summary table of the regression model results. Review the tbl_regression vignette for detailed examples.

Usage

```
tbl_regression(
 х,
  label = NULL,
  exponentiate = FALSE,
  include = everything(),
  show_single_row = NULL,
  conf.level = NULL,
  intercept = FALSE,
  estimate_fun = NULL,
 pvalue_fun = NULL,
  tidy_fun = NULL,
  show_yesno = NULL,
 exclude = NULL
)
```

Arguments

x	Regression model object	
label	List of formulas specifying variables labels, e.g. list(age ~ "Age, yrs", stage ~ "Path T Stage")	
exponentiate	Logical indicating whether to exponentiate the coefficient estimates. Default is FALSE.	
include	Variables to include in output. Input may be a vector of quoted variable names, unquoted variable names, or tidyselect select helper functions. Default is everything().	
show_single_row		
	By default categorical variables are printed on multiple rows. If a variable is dichotomous (e.g. Yes/No) and you wish to print the regression coefficient on a single row, include the variable name(s) here–quoted and unquoted variable name accepted.	
conf.level	Must be strictly greater than 0 and less than 1. Defaults to 0.95, which corresponds to a 95 percent confidence interval.	

intercept Logical argument indicating whether to include the intercept in the output. De-

fault is FALSE

estimate_fun Function to round and format coefficient estimates. Default is style_sigfig when

the coefficients are not transformed, and style_ratio when the coefficients have

been exponentiated.

Function to round and format p-values. Default is style_pvalue. The function pvalue_fun

must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. pvalue_fun = function(x)

style_pvalue(x,digits = 2) or equivalently, purrr::partial(style_pvalue,digits

= 2)).

Option to specify a particular tidier function if the model is not a vetted model tidy_fun

or you need to implement a custom method. Default is NULL

tbl_regression 45

```
show_yesno DEPRECATED exclude DEPRECATED
```

Value

A tbl_regression object

Setting Defaults

If you prefer to consistently use a different function to format p-values or estimates, you can set options in the script or in the user- or project-level startup file, '.Rprofile'. The default confidence level can also be set.

```
• options(gtsummary.pvalue_fun = new_function)
```

- options(gtsummary.tbl_regression.estimate_fun = new_function)
- options(gtsummary.conf.level = 0.90)

Note

The N reported in the output is the number of observations in the data frame model.frame(x). Depending on the model input, this N may represent different quantities. In most cases, it is the number of people or units in your model. Here are some common exceptions.

- 1. Survival regression models including time dependent covariates.
- 2. Random- or mixed-effects regression models with clustered data.
- 3. GEE regression models with clustered data.

This list is not exhaustive, and care should be taken for each number reported.

Example Output

  coxph(Surv(ttdeath, death) ~ trt + grade + stage + marker, trial) %>%
  tbl_regression(
    include = "trt";
    exponentiate = TRUE,
    label = list(trt ~ "Treatment (adjusted)")
  )
# first merging, then stacking
row1 <- tbl_merge(list(t1, t3), tab_spanner = c("Tumor Response", "Death"))</pre>
row2 <- tbl_merge(list(t2, t4))</pre>
tbl_stack_ex2 <-
  tbl_stack(list(row1, row2))
```

tbl_summary

Create a table of summary statistics

Description

The tbl_summary function calculates descriptive statistics for continuous, categorical, and dichotomous variables. Review the tbl_summary vignette for detailed examples.

Usage

```
tbl_summary(
```

48 tbl_summary

```
data,
by = NULL,
label = NULL,
statistic = NULL,
digits = NULL,
type = NULL,
value = NULL,
missing = c("ifany", "always", "no"),
missing_text = "Unknown",
sort = NULL,
percent = c("column", "row", "cell"),
group = NULL
```

Arguments

data A data frame

by A column name (quoted or unquoted) in data. Summary statistics will be cal-

culated separately for each level of the by variable (e.g. by = trt). If NULL,

summary statistics are calculated using all observations.

label List of formulas specifying variables labels, e.g. list(age ~ "Age,yrs", stage

~ "Path T Stage"). If a variable's label is not specified here, the label attribute (attr(data\$age,"label")) is used. If attribute label is NULL, the variable

name will be used.

statistic List of formulas specifying types of summary statistics to display for each vari-

able. The default is list(all_continuous() ~ "{median} ({p25},{p75})",all_categorical()

 \sim "{n} ({p}%)"). See below for details.

digits List of formulas specifying the number of decimal places to round continuous

summary statistics. If not specified, tbl_summary guesses an appropriate number of decimals to round statistics. When multiple statistics are displayed for a single variable, supply a vector rather than an integer. For example, if the statistic being calculated is "{mean} ({sd})" and you want the mean rounded to 1

decimal place, and the SD to 2 use digits = list(age $\sim c(1,2)$).

type List of formulas specifying variable types. Accepted values are c("continuous", "categorical", "

e.g. type = list(starts_with(age) \sim "continuous", female \sim "dichotomous"). If type not specified for a variable, the function will default to an appropriate

summary type. See below for details.

value List of formulas specifying the value to display for dichotomous variables. See

below for details.

missing Indicates whether to include counts of NA values in the table. Allowed values

are "no" (never display NA values), "ifany" (only display if any NA values), and "always" (includes NA count row for all variables). Default is "ifany".

missing_text String to display for count of missing observations. Default is "Unknown".

sort List of formulas specifying the type of sorting to perform for categorical data.

Options are frequency where results are sorted in descending order of frequency and alphanumeric, e.g. sort = list(everything() ~ "frequency")

percent Indicates the type of percentage to return. Must be one of "column", "row", or

"cell". Default is "column".

group DEPRECATED. Migrated to add_p

tbl_summary 49

Value

A tbl_summary object

select helpers

Select helpers from the \tidyselect\ package and \gtsummary\ package are available to modify default behavior for groups of variables. For example, by default continuous variables are reported with the median and IQR. To change all continuous variables to mean and standard deviation use statistic = list(all_continuous() ~ "{mean} ({sd})").

All columns with class logical are displayed as dichotomous variables showing the proportion of events that are TRUE on a single row. To show both rows (i.e. a row for TRUE and a row for FALSE) use type = list(all_logical() ~ "categorical").

The select helpers are available for use in any argument that accepts a list of formulas (e.g. statistic, type, digits, value, sort, etc.)

statistic argument

The statistic argument specifies the statistics presented in the table. The input is a list of formulas that specify the statistics to report. For example, statistic = list(age ~ "{mean} ({sd})") would report the mean and standard deviation for age; statistic = list(all_continuous() ~ "{mean} ({sd})") would report the mean and standard deviation for all continuous variables. A statistic name that appears between curly brackets will be replaced with the numeric statistic (see glue::glue).

For categorical variables the following statistics are available to display.

- {n} frequency
- {N} denominator, or cohort size
- {p} formatted percentage

For continuous variables the following statistics are available to display.

- {median} median
- {mean} mean
- {sd} standard deviation
- {var} variance
- {min} minimum
- {max} maximum
- {p##} any integer percentile, where ## is an integer from 0 to 100
- {foo} any function of the form foo(x) is accepted where x is a numeric vector

type argument

tbl_summary displays summary statistics for three types of data: continuous, categorical, and dichotomous. If the type is not specified, tbl_summary will do its best to guess the type. Dichotomous variables are categorical variables that are displayed on a single row in the output table, rather than one row per level of the variable. Variables coded as TRUE/FALSE, 0/1, or yes/no are assumed to be dichotomous, and the TRUE, 1, and yes rows are displayed. Otherwise, the value to display must be specified in the value argument, e.g. value = list(varname ~ "level to show")

50 tbl_survfit

Example Output

```

Examples

```
tbl_summary_ex1 <-
  trial[c("age", "grade", "response")] %>%
  tbl_summary()
tbl_summary_ex2 <-
  trial[c("age", "grade", "response", "trt")] %>%
  tbl_summary(
   by = trt,
   label = list(age ~ "Patient Age"),
   statistic = list(all_continuous() ~ "{mean} ({sd})"),
   digits = list(age \sim c(0, 1))
# for convenience, you can also pass named lists to any arguments
# that accept formulas (e.g label, digits, etc.)
tbl_summary_ex3 <-
  trial[c("age", "trt")] %>%
  tbl_summary(
   by = trt,
   label = list(age = "Patient Age")
```

tbl_survfit

Creates table of survival probabilities

Description

Experimental Function takes a survfit object as an argument, and provides a formatted summary table of the results

Usage

```
tbl_survfit(
   x,
   times = NULL,
   probs = NULL,
```

tbl_survfit 51

```
statistic = "{estimate} ({conf.low}, {conf.high})",
label = NULL,
label_header = NULL,
estimate_fun = NULL,
missing = "--",
conf.level = 0.95,
failure = FALSE
)
```

Arguments

X	<pre>survfit object. Object may have no stratification (e.g. survfit(Surv(ttdeath, death) ~ 1, trial)), or a single stratifying variable (e.g. survfit(Surv(ttdeath, death) ~ trt, trial))</pre>
times	numeric vector of times for which to return survival probabilities.
probs	numeric vector of probabilities with values in $(0,1)$ specifying the survival quantiles to return
statistic	string defining the statistics to present in the table. Default is "{estimate} ({conf.low}, {conf.high})"
label	string specifying variable or overall label. Default is stratifying variable name or "Overall" when no stratifying variable present
label_header	string specifying column labels above statistics. Default is "{prob} Percentile" for survival percentiles, and "Time {time}" for n-year survival estimates
estimate_fun	function to format the Kaplan-Meier estimates. Default is style_percent for survival probabilities and style_sigfig for survival times
missing	text to fill when estimate is not estimable. Default is ""
conf.level	Confidence level for confidence intervals. Default is 0.95
failure	Calculate failure probabilities rather than survival probabilities. Default is FALSE. Does not apply to survival quantile requests

Example Output

Author(s)

Daniel D. Sjoberg

```
library(survival)
fit1 <- survfit(Surv(ttdeath, death) ~ trt, trial)
fit2 <- survfit(Surv(ttdeath, death) ~ 1, trial)

tbl_survfit_ex1 <- tbl_survfit(
   fit1,
    times = c(12, 24),
   label = "Treatment",
   label_header = "**{time} Month**"
)

tbl_survfit_ex2 <- tbl_survfit(</pre>
```

52 tbl_uvregression

```
fit2,
probs = 0.5,
label_header = "**Median Survival**"
)
```

tbl_uvregression

Display univariate regression model results in table

Description

This function estimates univariate regression models and returns them in a publication-ready table. It can create univariate regression models holding either a covariate or outcome constant.

For models holding outcome constant, the function takes as arguments a data frame, the type of regression model, and the outcome variable y=. Each column in the data frame is regressed on the specified outcome. The tbl_uvregression function arguments are similar to the tbl_regression arguments. Review the tbl_uvregression vignette for detailed examples.

You may alternatively hold a single covariate constant. For this, pass a data frame, the type of regression model, and a single covariate in the x= argument. Each column of the data frame will serve as the outcome in a univariate regression model. Take care using the x argument that each of the columns in the data frame are appropriate for the same type of model, e.g. they are all continuous variables appropriate for lm, or dichotomous variables appropriate for logistic regression with glm.

Usage

```
tbl_uvregression(
 data,
 method.
 y = NULL,
  x = NULL
 method.args = NULL,
  formula = "{y} \sim {x}",
  exponentiate = FALSE,
  label = NULL,
  include = everything(),
  exclude = NULL,
 hide_n = FALSE,
  show_single_row = NULL,
  conf.level = NULL,
  estimate_fun = NULL,
  pvalue_fun = NULL,
  show_yesno = NULL,
  tidy_fun = NULL
)
```

Arguments

data	Data frame to be used in univariate regression modeling. Data frame includes	
	the outcome variable(s) and the independent variables.	
method	Regression method (e.g. lm, glm, survival::coxph, and more).	
У	Model outcome (e.g. $y = recurrence or y = Surv(time, recur)$). All other	
	column in data will be regressed on v. Specify one and only one of v or x	

tbl_uvregression 53

Model covariate (e.g. x = trt). All other columns in data will serve as the Χ outcome in a regression model with x as a covariate. Output table is best when x is a continuous or dichotomous variable displayed on a single row. Specify one and only one of y or x method.args List of additional arguments passed on to the regression function defined by method. formula String of the model formula. Uses glue::glue syntax. Default is " $\{y\} \sim \{x\}$ ", where {y} is the dependent variable, and {x} represents a single covariate. For a random intercept model, the formula may be formula = " $\{y\} \sim \{x\} + (1 \mid$ gear)". exponentiate Logical indicating whether to exponentiate the coefficient estimates. Default is FALSE. label List of formulas specifying variables labels, e.g. list(age ~ "Age, yrs", stage ~ "Path T Stage") Variables to include in output. Input may be a vector of quoted variable names, include unquoted variable names, or tidyselect select helper functions. Default is everything(). exclude **DEPRECATED** hide_n Hide N column. Default is FALSE show_single_row By default categorical variables are printed on multiple rows. If a variable is dichotomous (e.g. Yes/No) and you wish to print the regression coefficient on a single row, include the variable name(s) here-quoted and unquoted variable name accepted. conf.level Must be strictly greater than 0 and less than 1. Defaults to 0.95, which corresponds to a 95 percent confidence interval. estimate_fun Function to round and format coefficient estimates. Default is style_sigfig when the coefficients are not transformed, and style_ratio when the coefficients have been exponentiated. pvalue_fun Function to round and format p-values. Default is style pvalue. The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. pvalue_fun = function(x) style_pvalue(x,digits = 2) or equivalently, purrr::partial(style_pvalue,digits = 2)).show_yesno **DEPRECATED** tidy_fun Option to specify a particular tidier function if the model is not a vetted model

or you need to implement a custom method. Default is NULL

Value

A tbl_uvregression object

Example Output

Setting Defaults

If you prefer to consistently use a different function to format p-values or estimates, you can set options in the script or in the user- or project-level startup file, '.Rprofile'. The default confidence level can also be set.

54 tbl_uvregression

- options(gtsummary.pvalue_fun = new_function)
- options(gtsummary.tbl_regression.estimate_fun = new_function)
- options(gtsummary.conf.level = 0.90)

Note

The N reported in the output is the number of observations in the data frame model.frame(x). Depending on the model input, this N may represent different quantities. In most cases, it is the number of people or units in your model. Here are some common exceptions.

- 1. Survival regression models including time dependent covariates.
- 2. Random- or mixed-effects regression models with clustered data.
- 3. GEE regression models with clustered data.

This list is not exhaustive, and care should be taken for each number reported.
